X5 Bar 1000

User Manual

Software version v.1.1.3

Rev. 20240207-01

Document revisions

Revision number	Notes	Released
20240207-01	Added tilt disable to DMX Control/Settings channel (correction). Covers firmware v. 1.1.3	February 2024
20231023-01	First public release. Covers software version 1.1.3	November 2023

GLP® impression X5 Bar 1000 User Manual

1. Safety

Key to symbols

The following symbols are used in this document:

Warning! Safety hazard.
Risk of severe injury or death.

Warning! Hazardous voltage.
Risk of lethal or severe electric shock.

Warning! See user documentation for important safety information.

Warning! Fire hazard.

Warning! Risk of eye injury.

Warning! Hot surface. Risk of burn injury.

Warning! Read the impression X5 Bar 1000 Quick Start and Safety Manual supplied with the fixture and available for download from www.glp.de before installing, operating or servicing the fixture. The Quick Start and Safety Manual contains important information for the safe use of impression X5 Bar 1000 fixtures. If you fail to read that information you may create a safety hazard with a risk of serious or lethal injury or damage.

If you have any doubts or questions about how to use the GLP® impression X5 Bar 1000 lighting fixture safely, contact your GLP supplier for assistance. Your GLP supplier will be happy to help.

The user documentation for impression X5 Bar 1000 fixtures consists of three documents:

- The **impression X5 Bar 1000 Quick Start and Safety Manual**, supplied with fixtures and available for download from www.glp.de. The Quick Start and Safety Manual contains important safety information and installation instructions that the installer and user must read. It also contains dimensions drawings and technical specifications for the fixture.
- The **impression X5 Bar 1000 User Manual**, available for download from www.glp.de. The User Manual explains features and control of impression X5 Bar 1000 fixtures.
- The **impression X5 Bar 1000 DMX Channel Index**, available for download from www.glp.de. The Channel Index is a separate document containing the DMX control channel layout and DMX commands available in the fixture. This information is also included in the User Manual.

The impression X5 Bar 1000 is intended for use by experienced professionals with the knowledge and skills to set up, operate, and maintain high-powered, remotely controlled lighting equipment safely and efficiently. These operations require expertise that may not be provided in this manual.

- Respect all warnings and directions given in the fixture's user documentation and on the fixture. Read the fixture's Quick Start and Safety Manual and familiarize yourself with the safety precautions that it contains. GLP and affiliated companies will take no responsibility for damage or injury resulting from disregard for the information in the user documentation.
- Check the GLP website at www.glp.de and make sure that you have the latest versions of the fixture's Quick Start and Safety Manual and this user manual.
- Check the fixture software version indicated on page 2 of this user manual and then use the fixture's control panel to check the version installed in the fixture. If the versions are not the same, the user manual may still cover the fixture, because software updates do not always affect the use of the fixture. However, it is possible that this manual does not match the fixture perfectly. Software release notes can help clarify this question. You can consult software release notes and download the correct version of this user manual on the GLP website if necessary.
- Make both the Quick Start and Safety Manual and this user manual available to all persons who will install, operate or service the fixture. Save both documents for future reference.
- If you have any questions about the safe operation of the fixture, please contact an authorized GLP distributor (see list of distributors at www.glp.de).

GLP Service and Support

Contact information for the nearest GLP Service and Support is available online at www.glp.de/en/service, by email at info@glp.de, or by telephone at the following numbers:

- GLP Germany: +49 (7248) 927 1955
- GLP N. America: +1 818 767-8899

- GLP Nordic: +46 737 57 11 40

2. impression X5 Bar 1000 overview

Figure 1. impression X5 Bar IP 1000 overview

- A – Head
- B – Air vents
- C – Tilt lock
- D – AC mains power IN (Neutrik powerCON TRUE1 TOP)
- E – Neutrik etherCON port A for future control options, fail-safe*
- F – DMX IN (5-pin XLR)
- G – Safety cable attachment points (retractable)
- H – Control panel with backlit display
- I – NFC Sensor
- J – AC mains power THRU (Neutrik powerCON TRUE1 TOP)
- K – DMX THRU (5-pin XLR)
- L – Neutrik etherCON port B for future control options, fail-safe*
- M – Alignment pins button

**Additional control options are in preparation for a future firmware release*

3. Features

The impression X5 Bar 1000 is a powerful LED-based linear format lighting fixture from GLP. It features a head that tilts through 195° with GLP's patented fast movement system.

The fixture contains 18 x 40 Watt RGLB LED sources. Each source features smooth, full range color mixing with a homogenized Fresnel lens. The fixture also has motorized fast-action zoom.

The fixture offers a powerful multi-layer color and zoom effects engine.

Fixtures feature an alignment system that lets you build unbroken lines of pixels, and power and data can be daisy-chained for ease of installation. The impression X5 Bar 1000 can be placed upright on a level surface or suspended from a suitable structure as described in the fixture's Quick Start and Safety Manual.

A filter slide-in system with mounting channels on the front of the head allows optical accessories from GLP (such as an asymmetric beamshaper filter) to be installed in seconds without the use of tools.

Control options

The impression X5 Bar 1000 is compatible with DMX 512 and RDM control protocols. Other control options via Ethernet are currently in preparation for inclusion in a future firmware release.

The fixture also features GLP iQ.Mesh and GLP's FPO (Flexible Protocol Option) Port. The GLP iQ.Mesh Module allows easy configuration, control, service and maintenance via the GLP iQ.Service App. The FPO port allows you to use control options such as LumenRadio CRMX if a CRMX module accessory is installed. The CRMX and other FPO modules can be supplied on request (GLP Service can give details).

Powering on

See Figure 2. Slide the tilt lock button towards the center of the fixture to release the tilt lock before applying power to the fixture.

When power is applied to the fixture and no valid DMX signal is present, the head moves automatically to its home position (tilt center).

Tilt

The impression X5 Bar 1000 has motorized tilt movement with coarse and fine control channels.

Direction of tilt movement

With the fixture standing on the ground, increasing the tilt DMX value moves the head towards the front from its home position. Tilt direction can be reversed using the **Fixture Settings** → **Tilt Invert** setting (see 'Tilt invert' on page 22) or via DMX on the Special/Control channel. This can be useful when setting up symmetrical movement in multiple fixtures.

Figure 2. Tilt lock button

Tilt position feedback and self-correction

The fixture has a tilt position feedback and self-correction system that brings the head back to its correct position if it was unintentionally moved. When correcting tilt, the fixture at first tries twice to move to the correct position. If it cannot move to this position, it waits for a short period and then tries again. Position feedback is automatically disabled for a short time if you press one of the control panel buttons. This feature lets an operator move the head manually. Tilt remains disabled while you are using the fixture's control panel.

Position feedback can also be set to constantly disabled using the Fixture Settings options. See 'Tilt disable' on page 22.

Fixture performance and speed options

You can adjust the speed (and noise level) of tilt and zoom movement by selecting from three different performance options (see 'Performance modes' on page 21).

Zoom

The impression X5 Bar 1000 has motorized zoom control that lets you vary the beam angle from spot to flood as the DMX value increases.

You can adjust the speed (and noise level) of zoom movement, as well as the speed of all other mechanical effects, by selecting from three different performance options (see 'Performance modes' on page 21).

Main and Sub modules (Main and Sub fixtures)

Some control modes divide the fixture into two or more modules (Main module and Sub modules). For example, Control Modes 2-4 divide the fixture into:

- Main module (Layer 1) = one RGB(L) Wash fixture
- Sub module (Layer 2) = pattern engine with segment or individual pixel control.

The Sub module has its own intensity and shutter channels. Professional controllers will handle this setup in a smart multi-fixture profile.

The **Sub module mode** setting lets you decide whether the Sub module should be subordinate to or independent of the Main module (see (see 'Sub module mode / Sub fixture mode' on page 20).

Individual segment or pixel control

The impression X5 Bar 1000 provides eighteen individually controllable pixels. Each pixel cell houses a 40 W RGBL LED that can be controlled individually in intensity and color to create dynamic effects and pixel mapping.

The fixture's different DMX control modes offer different options for working with the individual segments or pixels.

In nearly all DMX modes, the Main module gives color mixing control of all eighteen pixels together as one segment.

- **Mode 1 (Basic)** provides a Main module with color mixing control of all pixels together as one segment.
- **Mode 2 (Normal)** adds a Sub module as a second layer with pattern effects and color mixing of all pixels as one segment.
- **Mode 3 (Segment)** adds Sub module(s) as a second layer with pattern effects and color mixing of three segments: the inner, middle and outer rings.
- **Mode 4 (Multipix Advanced)** adds Sub module(s) as a second layer with pattern effects and RGB color mixing of each individual pixel.
- **Mode 5 (Multipix Compressed RGB)** is a pixel mapping mode which offers the main overall control options plus RGB color mixing of each individual pixel.
- **Mode 6 (Multipix Compressed RGBL)** is a pixel mapping mode which offers the main overall control options plus RGBL color mixing of each individual pixel.

Color mixing

The fixture's Main module features 16-bit color mixing with RGB, RGBL or x;y (CIE 1931) Color Mix control options. See 'Color Mix Mode' on page 16.

Note: The Color Mix Mode of the Sub module(s) is always RGB. For more details, see 'Color Mix Mode' on page 16.

iQ.Gamut

iQ.Gamut is a new LED calibration technology from GLP that defines the color gamut for the color mix channels. You can select one of a range of calibrated iQ.Gamuts for the fixture to work within. This feature can be useful if you want to reproduce correct colors or avoid TV camera clipping. See 'iQ.Gamut' on page 18.

Mix Priority

The Mix Priority channel defines how the color mixing output of the Main module (Layer 1) and the color mixing output of the Sub module(s) (Layer 2) are merged together – or which value has higher priority. This lets you switch between the layers or create special effects using both layers.

The Mix Priority channel gives the following options:

- **Main + Sub (HTP)** – The fixture takes whichever color value of the Main module or Sub module is highest and uses that value to determine the output color (Highest Takes Priority).
- **Main Only** – The Sub module color value is ignored. The fixture uses the color value of the Main module.
- **Sub Only** – The Main module color value is ignored. The fixture uses the color value of the Sub module.

- **Main + Sub additive** – The Sub module color value is added to the Main module color value. The fixture uses the sum of both values.
- **Main - Sub subtractive** – The Sub module color value is subtracted from the Main module color value.
- **Sub - Main subtractive** – The Main module color value is subtracted from the Sub module color value.
- **TrueColor Main over Sub Snap** – Sub module color stays in the background. Main module color has higher priority and will not mix with Sub module color. As soon the Main module color value is greater than zero, Sub module color blacks out and the fixture uses the Main module color.
- **TrueColor Sub over Main Snap** – Main module color stays in the background. Sub module color has higher priority and will not mix with the Main module color. As soon as Sub module color value is greater than zero, Main module color blacks out and the fixture uses Sub module color.
- **TrueColor Main over Sub Crossfade** – Sub module color stays in the background. Main module color has higher priority. If you fade in a Main module color, Sub module color will crossfade to the Main module color.
- **TrueColor Sub over Main Crossfade** – Main module color stays in the background. Sub module color has higher priority. If you fade in a Main module color, Sub module color will crossfade to the Main module color.
- **Main to Sub Crossfade** – Manually crossfading from Main module color only → Main and Sub module color (HTP) → Sub module color only.

White Point

The white point is the default white that is obtained when the shutter is opened. The impression X5 Bar 1000 offers a choice of fixed white points in RGB Color Mix Mode, allowing convenient use in different environments. For details of setting the white point, see 'White Point' on page 18.

Color temperature control (CTC)

In addition to the choice of default fixed white point, the fixture offers Color Temperature Correction (CTC) in all three color mixing control modes (RGB, RGBL and x;y). The CTC Channel allows a temporary change of white point and offers a smooth shift between whites from 10.000 K to 2500 K following the black body line.

Depending on the selected Color Mix Mode (RGB, RGBL or x;y), if you select a color temperature on the CTC channel, the fixture will no longer use the specific open color and will instead use the selected color temperature.

If you select a color temperature on the CTC channel, it is still possible to manipulate the color temperature using the RGB and RGBL channels.

Note: To obtain the desired color temperature on the CTC channel, you must set all Color Mix channels to 100%. If they are not at 100%, the system will mix color relative to the selected white point of the CTC channel.

The CTC channel affects all the fixture's modules. Setting the CTC channel to a specific color temperature will affect the open white of the Main module and Sub modules.

Color Quality Control (CQC)

The CQC channel lets you modify the spectral mix of the white output in order to achieve a balance between better color rendering or higher output intensity. The following options are available:

- **High Quality (HQ)** deploys multiple LEDs to create a richer light spectrum that gives improved color rendering but also slightly lower output. Color is mixed with priority given to the best white color rendering quality. Saturated colors will have maximum saturation at DMX 000 and will smoothly become unsaturated until they reach 0% saturation (= white) at DMX value 127.
- **High Output (HO)** gives higher output intensity but reduced color rendering performance. Color is mixed with priority given to the highest output in white. Saturated colors will have maximum saturation at DMX 255 and will smoothly become unsaturated until they reach 0% saturation (= white) at DMX value 128.

While using white light, the CQC channel lets you change between white with priority on high-quality color rendering and white with priority on highest output. Additionally, the CQC channel lets you smoothly desaturate colors. If you have set a saturated color in the color mix, the CQC channel lets you smoothly desaturate the color from saturated to fully unsaturated (i.e. white).

Note: The CQC channel affects all the fixture's modules. Setting the CQC channel to a specific value will affect the colors of the Main module and Sub modules.

*Note: The **HO** and **HQ** CQC options only affect the color mix if the fixture is in RGB or x;y Color Mix mode. In all other Color Mix modes this setting has no effect.*

Magenta/Green Shift (M/G Shift)

The Magenta/Green Shift channel lets you move the color coordinate of a white point, a mixed color or a selected CTC color along a vertical line on the color temperature curve in all three Color Mix modes. The corresponding white point is either shifted towards Green or Magenta.

If M/G Shift is enabled, it immediately affects all mixed colors as well as the color temperature that is selected on the CTC channel. It has no effect on the colors of the virtual color wheel.

Note: The M/G Shift channel affects the entire fixture. Setting the M/G Shift channel to a specific value will affect the output of the Main module and Sub modules.

Color wheel

The impression X5 Bar 1000 features a virtual color wheel channel that gives quick access to a wide range of LEE-referenced colors in all three Color Mix modes. Color wheel color presets are always mixed with the best available spectrum. Color filter color coordinates are based on a Source C (daylight) light source.

Besides static color presets, the color wheel channel also offers continuous color scrolling through HSI colors. When set to HSI Scroll, the fixture runs through saturated HSI colors with variable speed from slow to fast.

The crossfade time of a color change is relative to the speed: at slow speeds colors crossfade smoothly and at fast speeds colors snap.

If a color coordinate is outside the possible color gamut of the light source, the fixture tries to match the target color as closely as possible.

Note: Color wheel color presets have higher priority than the Color Mix, CTO and M/G Shift channels.

The virtual color wheel channel must be set to DMX 000 in order to use normal RGB, RGLB or x:y color mixing.

Tungsten simulation

When a tungsten lamp is dimmed, there is a small delay in intensity changes and there is a color shift along the black body line. The tungsten simulation channel allows the user to select between different tungsten options in all three Color Mix modes.

The first part of the Tungsten channel offers standard tungsten features with fixed color temperature, red shift and delayed intensity changes. The color temperature as well as the color shift and inertia of the selected light source are fully simulated. Tungsten mode has higher priority than the color wheel or CTC.

The second part of the Tungsten channel lets you apply one of the corresponding tungsten effects (inertia and intensity) to the currently set mixed color or currently selected color temperature on the CTC channel.

Note: The Tungsten simulation channel affects the entire fixture. Setting the Tungsten channel to a specific value will affect the output of the Main module and Sub module.

Shutter

The fixture's shutter channel offers continuous blackout, continuous open and a range of intensity effects.

Depending on the selected Subfixture Mode, the shutter channel of the Main module channel group acts as either a master shutter or as the shutter channel of the Main module independently of the Sub module.

The following shutter effects are available:

- **Single flash** performs exactly one single flash with each value change within this DMX value slot.
- **Pulse** dims up and down smoothly with the same fade-in and fade-out times. Speed can be adjusted from slow to fast.
- **Pulse open** fades in and then snaps to blackout. Speed can be adjusted from slow to fast.
- **Pulse close** fades out and then snaps to full. Speed can be adjusted from slow to fast.

- **Strobe double flash** provides a quick double flash. Speed can be adjusted from slow to fast.
- **Strobe pixel random** (only available when the fixture is set to a DMX mode with individual pixel control) strobes individual pixels at random to give a kind of sparkling effect. Speed can be adjusted from slow to fast.
- **Strobe random** strobes all of one fixture's pixels together at random intervals, allowing a random strobe between multiple fixtures. Speed can be adjusted from slow to fast. *Note that the random effect across multiple fixtures really is random!*
- **Strobe** strobes all of one fixture's pixels together and also perfectly synchronizes the strobe in multiple fixtures so that all the fixtures flash at exactly the same time. Speed can be adjusted from slow to fast.

Note: Depending on the selected Subfixture Mode, the dimmer and shutter channels of the Sub modules can operate independently of or subordinately to the dimmer and shutter channels of the Main module.

Dimmer

The electronic dimming effect provides smooth 16-bit dimming of the Main module and Sub module. Three dimming curves with different dimming characteristics are available. See 'Dimming curves' on page 19.

Pattern control

The impression X5 Bar 1000 offers a wide range of static and dynamic pre-programmed FX patterns on the Sub modules. The Sub module color control channels define the color of the pattern effects.

A static pattern is a fixed pattern with only one pattern step. This allows you a very quick selection of a non-dynamic effect. It has active and inactive pixels. Each active pixel shows the selected pattern color while each inactive pixel is fully transparent.

A dynamic pattern is a sequence of multiple pattern steps and has active and inactive pixels. Each active pixel shows the selected pattern color while each inactive pixel is fully transparent. You can set pattern steps to automatically change continuously (Pattern Speed) or you can directly select pattern steps (Pattern Index).

Note: The Mix Priority channel lets you decide how the output of the Main module and the Sub module (pattern or pixel mapping) should be merged.

Pattern selection

The pattern selection channel offers a choice of 59 static patterns, 50 dynamic patterns and 11 special patterns. The dynamic patterns offer multiple pattern steps for individual step selection or continuous pattern step chasers.

Pattern 0 (DMX 000) is the idle pattern and just sets all pixels to active.

The Random Pixel FX pattern at the end of the Pattern Select channel randomly selects pixels to create an attractive sparkle effect.

Pattern speed/index

As a dynamic pattern is a sequence of multiple pattern steps, you can select either:

- an automatic clockwise or counterclockwise continuous run-through of the pattern steps with different speeds (dynamic speed control = DMX values 002 ... 127), or
- one of the available specific pattern steps (static indexing = DMX values 128 ... 255).

Note: Bear in mind that different patterns can have a different number of pattern steps. This can affect synchronization between fixtures, for example, if you run different patterns in multiple fixtures.

Pattern step crossfading

The Pattern Step Crossfading channel lets you choose how one step in a pattern should change into the next step. This change can be a snap, a normal crossfade or a fade with tail (quick fade in and variable long fade out).

Pattern transition

The Pattern Transition channel lets you choose how Pattern A should change into Pattern B. This change can be a snap, a soft crossfade, a Fade Over Blackout (FOB) or Fade Over Full (FOF).

Fixture total number and fixture position

The Fixture Total Number (or Fixture Quantity) and Fixture Position channels let you set up FX pattern chases and synchronized pattern action in multiple fixtures when you activate dynamic FX. The impression X5 Bar 1000 can manage patterns in fixture groups containing up to 255 fixtures.

The Fixture Total Number channel lets you define the total number of fixtures in the fixture group that the pattern should run on.

The Fixture Position channel lets you define the fixture's position in the fixture group.

Special/Control DMX channel

The Special/Control DMX channel lets you change fixture settings and perform a fixture reset from the control desk (a possibility that can be very useful during a show or for a specific scene). To apply a command on the Special/Control channel, you must hold the command for the time indicated in the DMX channel index section at the end of this user manual.

To trigger a reset using the Special/Control channel, you must send the DMX value for this function for 3 seconds. If you want to trigger an additional reset using the Special/Control channel, you must first move away from the Reset DMX value and then return to this value. This requirement to change DMX values eliminates the risk of the fixture entering an unwanted Reset loop if it is patched wrongly.

Note: Most of the fixture settings available in the fixture's control menus or on the Special/Control DMX channel are also available via RDM.

4. Fixture Settings

The settings described in this chapter let you customize the impression X5 Bar 1000. Settings can be available in the control panel, via DMX and/or via RDM.

Color Mix Mode

The Color Mix Mode setting offers three different options for color mixing:

RGB Mode

RGB Mode mixes color of the main and sub module(s) using Red, Green and Blue channels. The Lime LED is mixed automatically using the fixture's internal GLP iQ.Gamut algorithm.

RGB Mode offers a clean default white light at open which is considered to be the white point (RGB at 100%).

When the **Color Mix Mode** is set to **RGB**, the different DMX Modes have the following functionality:

- Mode 1 – Basic
 - Main Module: RGB control of all pixels as one group with Lime mixed automatically. Lime Channel has no function.
- Mode 2 – Normal
 - Main Module: RGB control of all pixels as one group with Lime mixed automatically. Lime Channel has no function.
 - Sub Module (Layer 2): RGB control of all pixels as one group with Lime mixed automatically.
- Mode 3 – Segment
 - Main Module: RGB control of all pixels as one group with Lime mixed automatically. Lime Channel has no function.
 - Sub Module (Layer 2): RGB control of each segment with Lime mixed automatically.
- Mode 4 – Multipix
 - Main Module: RGB control of all pixels as one group with Lime mixed automatically. Lime Channel is dead.
 - Sub Module (Layer 2): RGB control of each pixel with Lime mixed automatically.
- Mode 5 – Multipix Compressed RGB
 - RGB control of each pixel with Lime mixed automatically.
- Mode 6 – Multipix Compressed RGBL
 - RGBL control of each pixel.

RGBL Mode

RGBL Mode mixes color of the main module using Red, Green, Blue and Lime channels. The colors of the Sub module(s) are mixed with RGB only - always without Lime. The color gamut is still calibrated to the impression X5 range, but the white point

(open) is not adjusted to the black body line and will show a white that is mixed using 100% RGBL.

*Note: The **HO** and **HQ** CQC options are not available in RGBL Mode.*

When the **Color Mix Mode** is set to **RGBL**, the different DMX Modes have the following functionality:

- Mode 1 – Basic
 - Main Module: RGBL control of all pixels as one group with individual Lime control.
- Mode 2 – Normal
 - Main Module: RGBL control of all pixels as one group with individual Lime control.
 - Sub Module (Layer 2): RGB control of all pixels as one group without automatically mixed Lime. Lime is always 0%.
- Mode 3 – Segment
 - Main Module: RGBL control of all pixels as one group with individual Lime control.
 - Sub Module (Layer 2): RGB control of each segment without automatically mixed Lime. Lime is always 0%.
- Mode 4 – Multipix
 - Main Module: RGBL control of all pixels as one group with individual Lime control.
 - Sub Module (Layer 2): RGB control of each pixel without automatically mixed Lime. Lime is always 0%.
- Mode 5 – Multipix Compressed RGB
 - RGB control of each pixel with Lime mixed automatically.
- Mode 6 – Multipix Compressed RGBL
 - RGBL control of each pixel.

x:y Mode

x:y Mode lets you send x;y color coordinates to the fixture via DMX. The internal color algorithm mixes the four LED colors perfectly to match the x;y color coordinates.

In x:y Mode, white point setting is disabled. CTC channel values overwrite x;y values.

When the **Color Mix Mode** is set to **x:y**, the different DMX Modes have the following functionality:

- Mode 1 – Basic
 - Main Module: x;y control of all pixels as one group
- Mode 2 – Normal
 - Main Module: x;y control of all pixels as one group.
 - Sub Module (Layer 2): RGB control of all pixels as one group with automatically mixed Lime.

- Mode 3 – Segment
 - Main Module: x;y control of all pixels as one group.
 - Sub Module (Layer 2): RGB control of each segment with automatically mixed Lime.
- Mode 4 – Multipix
 - Main Module: x;y control of all pixels as one group
 - Sub Module (Layer 2): RGB control of each pixel with automatically mixed Lime.
- Mode 5 – Multipix Compressed RGB
 - RGB control of each pixel with automatically mixed Lime.
- Mode 6 – Multipix Compressed RGBL
 - RGBL control of each pixel.

White point

The white point is the default white that is obtained when the shutter is opened. The impression X5 Bar 1000 offers a choice of fixed white points in RGB Color Mix Mode, allowing convenient use in different environments. The following fixed white points (color temperatures) are available:

- **8000 K** (effect light)
- **6500 K** (daylight – default)
- **5600 K** (TV and studio)
- **4200 K** (CDM)
- **3200 K** (tungsten)

If a fixed white point is enabled, the fixture mixes colors with reference to it. GLP iQ.Gamut navigates through the color space using the preferred Color Mode color mixing method.

Note: Fixed white point settings are only valid for RGB mode using the iQ.Gamut FULL. If any of the other defined color gamuts is selected, the defined white point of the selected color gamut is applied.

iQ.Gamut

iQ.Gamut is a new LED calibration technology from GLP that defines the color gamut for the color mixing channels. You can select one of a range of calibrated iQ.Gamuts for the fixture to work within. This feature can be useful if you want to reproduce correct colors or avoid TV camera clipping. The iQ.Gamut setting will only affect the color mix if the fixture is in **RGB** Color Mix Mode. In all other Color Mix modes this setting has no effect.

The following iQ.Gamut settings are available:

- **FULL** (default) – Color mixing is calibrated to the impression X5 color gamut and referenced to the selected fixed white point. This setting gives the best results with applications where deep saturated colors are needed.

- **Rec.2020** – Color mixing is matched to the defined Rec.2020 gamut including its white point. This setting gives best results for UHD TV applications and avoids color clipping.
- **Rec.709** – Color mixing is matched to the defined Rec.709 gamut including its white point. This setting gives best results for HD TV applications and avoids color clipping.
- **DCI P3.6** – Color mixing is matched to the defined DCI P3.6 gamut including its white point.

Dimming curves

The electronic dimming effect provides smooth 16-bit dimming of the Main module and Sub modules. The following three dimming curves are available:

Figure 3. Dimming curves

- The **Linear** setting gives a dimming curve that the eye perceives as linear.
- The **S-Curve** setting gives finer control at lower light levels and at higher light levels, with coarser control at medium light levels.
- The **Soft** setting gives finer control at lower light levels, where the eye is most sensitive to changes in light intensity, and coarser control at higher light levels.

Note: Depending on the selected Subfixture Mode, the dimmer and shutter channels of the Sub modules can operate independently of or subordinately to the dimmer and shutter channels of the Main module.

Fan modes

Five cooling fan modes let you give priority to lowest fan noise or most powerful cooling:

- **Regulated** mode gives priority to light output and only operates fans as necessary. If the fixture is blacked out, fans switch off after some seconds. Only the fans that are necessary operate, and they run at minimum speed. When light output intensity is increased, temperature regulation increases fan speed to the level necessary to keep the fixture at optimum temperature.

If light output is set to maximum intensity but the fans can keep the fixture at optimum temperature, there is no regulation of light intensity. If the fixture begins to exceed optimum temperature and the fans are running at maximum speed, light intensity is limited until optimum temperature can be maintained.

- **High** mode sets the fixture to give maximum light output and suits operation in high ambient temperatures. Fans are set to constant operation at high speed. Light output intensity is limited smoothly if it becomes necessary in order to keep fixture temperature at optimum level.

You can also use **High** mode to cool down a fixture quickly after a period of operation or to help remove dust from cooling fans.

- **Medium** mode sets fans to constant operation at medium speed. Light output intensity is reduced to a level where it will normally remain constant at ambient temperatures of up to 45° C (113° F). Intensity is smoothly limited further if it becomes necessary in order to keep fixture temperature at optimum level.
- **Low mode** sets fans to constant operation at low speed and is optimized for minimum noise. Light output intensity is reduced to a level where it will normally remain constant at ambient temperatures of up to 30° C (86° F). Intensity is smoothly limited further if it becomes necessary in order to keep fixture temperature at optimum level.
- **Minimum** mode operates as follows:
 - If the fixture is at blackout, all unnecessary fans are shut down completely and only fans that are absolutely necessary remain active. These fans operate at low speed.
 - As soon as the fixture emits light, other necessary fans may start but will stay at minimum speed. Light output is limited.

Note: In all fan modes, if fixture temperature reaches a dangerous level, the LEDs are shut down for a period until the fans have brought the temperature down to a safe level.

Sub module mode / Sub fixture mode

The impression X5 Bar 1000 offers two options for controlling the Main module and Sub modules:

- **Normal** – In this mode, all Sub module channels are subordinate to the Main module channel group. This means that the intensity and shutter of the Main module act as master intensity and master shutter for the whole fixture.
- **Independent** – In this mode, the Sub module channel group can be controlled independently of the Main module channel group and acts as an independent fixture.

Note that no matter which Sub module mode setting you select:

- The **Mix Priority** channel is still active and will affect how the two dependent or independent fixtures are mixed.
- Some of the general color management channels of the Main module such as CTC, CQC, M/G-Shift and Tungsten simulation will still affect the Sub module.

Performance modes

You can select between three different settings for the movement speed of the fixture's tilt movement and zoom effect:

- **Normal** sets movement to give an optimum balance between speed, quietness and smoothness. **Normal** is the default setting.
- **Fast** sets movement to maximum speed. This setting gives very fast movement but can result in higher noise levels.
- **Smooth** optimizes the smoothness of the effects and gives lowest-noise performance. This setting gives extremely low noise and smooth performance, but movement will be slower than in **Normal** mode.

PWM frequency

This setting lets you select between different LED PWM frequencies for different applications and adjust frequencies to give the best results at different camera shutter frequencies. Changing the PWM frequency can improve dimming performance or help avoid flicker and beat frequencies in video images.

The following PWM settings are available:

- **Low** – PWM frequency is fixed at a lower level, giving best dimming results.
- **Optimum** (default) – PWM frequency is set to a level which offers a good compromise between best dimming results and avoiding flicker.
- **High1** – PWM frequency is set to a higher level.
- **High2** – PWM frequency is set to a higher level than High 1.
- **Max** – PWM frequency is set to the highest possible level. Use this setting for slow motion video or high speed camera applications. Dimming resolution at this setting is not as good as the other PWM settings.

Note: A higher PWM frequency may affect dimming performance. The PWM frequency setting is stored in the fixture and is not affected by cycling power off and on. However, it will be affected if you use the Factory Defaults command in the control menus. As a rule, you should set all the fixtures in an installation to the same PWM frequency in order to ensure the same performance.

Pixel mirror

The **Pixel mirror** setting lets you flip the fixture's pixel layout:

Off gives the standard pixel layout (see ‘

- Pixel layout' on page 38**Error! Bookmark not defined.**). Pixel 01 is at the Power and DMX THRU connectors end of the fixture and pixel 18 is at the Power and DMX IN connectors end of the fixture.
- **y-mirror** flips the pixel layout over the y-axis. Pixel 18 is at the Power and DMX THRU connectors end of the fixture and pixel 01 is at the Power and DMX IN connectors end of the fixture.

No signal

The **No signal** settings let you manage how the fixture behaves if no DMX signal is present (if the fixture is being controlled by DMX but the DMX signal stops, or if you apply power to the fixture when no DMX signal is present):

- **Blackout** sets the fixture to black out whenever it is not receiving a DMX signal. This is the default setting.
- **Hold** sets the fixture to continue using the last DMX values it received.
- **Scene (Stand-alone)** sets the fixture to play its stored stand-alone scene (see **Capture DMX Values** below) when the fixture is not receiving a DMX signal. If no stand-alone scene is stored in memory, the fixture will black out.

If the fixture is set to **Scene (Stand-alone)** and if a stand-alone scene has been stored in its memory using the **Capture DMX Values** command, it will display its stand-alone scene at all times when it is powered on but not receiving a DMX signal. You can therefore use this setting if you want fixtures to automatically start stand-alone operation when you apply power to them.

- **Capture DMX Values** takes a snapshot of the DMX values that are currently being received and stores them in the fixture's memory as its captured scene. The fixture will display this scene if it is set to **Scene (Stand-alone)** (see above) and is not receiving a DMX signal.

Tilt invert

Increasing the tilt DMX value moves the head from its home position towards the front of the fixture.

Changing the Tilt invert setting to ON inverts the tilt direction so that increasing the tilt value turns the head towards the back of the fixture.

Position feedback

Tilt auto-correction (position feedback) is normally enabled (ON). Changing this setting to OFF will disable the position feedback and auto-correction. If you need to return tilt to its correct position, you must perform a reset.

Tilt disable

Tilt disable is normally OFF. Changing the Tilt disable setting to "Current disable" de-activates tilt by disabling the tilt motor current.

Note: When changing from ON back to OFF to re-enable tilt movement, you must carry out a reset before you can operate tilt normally.

Display Mode

Gives different behavior options for the display in the fixture's control panel. This can be helpful in case of errors or during service operations. Three settings are available:

- **Auto** (default): the display automatically switches off after a few seconds if the fixture is receiving a valid control signal and has not detected an error. If the fixture is not receiving a valid control signal, the display will flash. If the fixture has detected an error, the display remains constantly on and shows the error.
- **On:** The display stays on constantly. This setting can be useful if you are configuring or servicing the fixture.
- **Off:** The display will automatically switch off after a few seconds even if the fixture is not receiving a valid control signal or if it has detected an error. Pressing any button turns on the display again.

Display Orientation

Lets you select **Normal**, **Upside-down** or **Auto** control panel display orientation.

If **Display Orientation** is set to **Auto**, changing the display orientation by pressing UP and DOWN at the same time will only change the display orientation until the next power cycle.

Hibernation

Lets you put the fixture into energy-saving mode and disables all electronic components apart from the DMX receiving module.

You can take the fixture out of hibernation mode with a power off/on cycle, via RDM or using the Special / Control DMX channel. If you do this, the fixture will perform a fixture reset before returning to normal operation.

Load User Settings

Lets you load different custom fixture configurations or return the fixture to the default fixture settings.

To save a custom setting preset from 1 to 3, see **Service → Advanced → Save_Settings**.

- **Load User Settings 1 to 3** loads one of three specific custom fixture settings. You must confirm the function for 3 seconds before the new settings are loaded (see **Fixture Settings → Load User Settings**).
- **Save User Settings 1 to 3** saves the current fixture settings as a set of user settings. You must confirm the function for 2 seconds in order to save the settings as one of the three custom settings presets (see **Service → Advanced → Save User Settings**).

*Note: The **Load User Setting Presets** and **Load User Setting Defaults** commands will only affect settings in the **Fixture Settings** group and will not affect DMX Address, Control Mode, Protocol Type, IP Settings, etc. This helps avoid loss of communication with the controller.*

Information

The **Information** submenu provides readouts of all relevant information such as the error list if any errors have been detected, the fixture's serial number, firmware version, device info, device hours counter, power cycles counter, DMX input monitor, signal quality etc.

Manual Control

This submenu gives different options for resetting the fixture manually. It can be helpful for service or stand-alone issues.

- **Reset All:** Performs a full fixture reset to initialize all features and effects.
- **Reset Tilt:** Resets tilt only to initialize the tilt position.
- **Reset Head:** Resets all the features in the head.

Manual DMX

Gives individual control of the fixture using the fixture user interface. The menu timeout function is disabled as long this menu is open.

- **Manual Control:** Manually sets a DMX value for each function.
- **Reset Manual values:** Resets all manual control values to default.

External DMX values will always have higher priority than manual control commands. Disconnect the fixture from the data source when using manual control.

Note: When entering manual control, be prepared for the fixture to start moving.

Service

The **Service** menu is split into two levels: **Service** and **Service Advanced**. The **Service Advanced** level is for trained technicians only. Read the information below carefully before entering this level.

The Service menu contains the following items:

- **Live Diagnostic:** Calls up an overview of all main fixture information, signal quality and settings. This can be helpful while troubleshooting or talking to GLP Service.
- **iQ.Service Connect:** Wakes up the integrated GLP iQ.Mesh Module for 5 minutes and enables connectivity to the GLP iQ.Service App.
- **Test All:** Runs a test sequence of all LEDs for a quick test of the fixture. Press BACK to stop the test sequence.
- **Test Tilt:** Runs a test sequence of tilt movement only. Press BACK to stop the test sequence.

- **Test LED:** Runs a test sequence of the LED pixel only. Press BACK to stop the test sequence.
- **Test Zoom:** Runs a test sequence of Zoom functionality only. Press BACK to stop the test sequence.
- **Test Fans (Auto):** Starts a fan self-test. Tries to detect fan errors, clears any current errors if successful.
- **Test Fans (Manual):** Tests fans one by one manually.
- **Test Encoders:** Auto test for all encoders.

Advanced Service

The **Advanced Service** level is for trained technicians only. Read the information below carefully before entering this level. You must confirm by pressing and holding ENTER for 3 seconds before you can enter this level.

The **Advanced Service** level contains the following items:

- **Service Mode:** Disables tilt and all display timeouts to make servicing the fixture head easier. This mode is automatically disabled after a power cycle.
- **Job Offset:** Lets you set +/- offsets on mechanical effects. Custom job offsets let you adjust fixtures in multiple installations (to compensate for the different positions of fixtures in a rig, for example).

Any custom job offsets that you create here will not affect the fixture's effect calibration.

All custom job offsets created here are deleted if you apply a **Load Factory Defaults** command.

- **Reset Counters:** Resets the different resettable fixture counters.
Device counters are not reset by a **Load Factory Backup** command.
- **Save User Settings:** Lets you save the current fixture settings to one of the three user settings presets. You can load a user settings preset that you have saved with a **Load User Settings** command (see **Fixture Settings → Load User Settings**). The default fixture preset cannot be changed.

This command only saves fixture settings (Fan Mode, Color Mix etc.). It does not save fixture configuration information such as DMX address and DMX mode.

- **Firmware Push (Fixture2Fixture):** Pushes the fixture's firmware (flash storage) to all other fixtures of the same type via the DMX link.

Important! The impression X5 Bar 1000 series firmware is fully compatible with all impression X5 series fixtures. This means that a firmware push carried out by an impression X5 Bar 1000 will also push its firmware to other impression X5 fixtures such as impression X5, impression X5 Compact, impression X5 Bar 1000 etc.

Load Factory Defaults

Reloads all factory defaults over the entire fixture and brings the fixture into standard show condition.

You must confirm the function for 3 seconds before the default settings are loaded.

Important! *The factory default settings that are reloaded with this command include all data and network configuration parameters such as DMX start address, IP configuration etc. You may therefore lose communication with your controller.*

The **Load Factory Defaults** command does not affect device counters and calibration.

Factory Menu

Important! *Do not enter the Factory Menu if you are not a trained service professional with service documentation or clear instructions from GLP Service. Read the user and service documentation carefully before entering this menu. In the Factory Menu you can apply critical settings which can damage the fixture.*

The Factory Menu is a hidden menu for the manufacturer or professional service technicians only. This special menu allows fixture calibration and the adjustment of all mechanical features following the manufacturer's instructions.

To enable the Factory Menu, apply power to the fixture and press the ENTER and BACK buttons together while the pre-boot screen is being displayed. You can release the buttons as soon as FACTORY MODE appears in the black display. After doing this, **Factory Menu** is visible as the last item in the main menu. The Factory Menu will remain available until the next power cycle. While the Factory Menu is enabled, all display timeouts are disabled to make working on the fixture easier and a Factory symbol is visible in the main screen.

5. Control panel

Warning! DMX control is disabled when the control menus are active. Be prepared for the head to move as soon as you exit the control menus.

The control panel and backlit graphic LCD display with self-charging battery allow you to change fixture settings, view readouts and use utilities quickly and intuitively, even when the fixture is disconnected from power.

To allow comfortable use of the control panel, tilt is automatically disabled for a few seconds if you press any button on the control panel. Tilt remains disabled for as long you are working in the control panel. If no button is pressed for a few seconds, head movement is re-enabled with tilt correction applied.

Figure 4. Default information screen

Default information screen

When power is applied, the fixture performs a reset. After the reset has completed, the default information screen appears in the control panel display on the side of the yoke.

At any other time, you can press any key to unlock the control panel. Doing this also calls up the default information screen in the control panel display.

See Figure 4. The top line of the default information screen consists of, from left to right:

- Main CPU firmware version
- DMX Mode

The center of the screen shows the following information:

- Signal source.
- Fixture's current DMX address in large characters. If the fixture's self-diagnosis system detects an error, the fixture will flash the error message alternately with the DMX address. This lets you see the DMX address and error message at a distance from the fixture.
- If the fixture detects a valid, active network at one of the fixture's etherCON ports, the default screen will show a network icon to the left or right of the DMX address:
 - Icon on left = data at Port A (on left of fixture when facing control panel)
 - Icon on right = data at Port B (on right of fixture when facing control panel)

The fixture displays network speed below the network icon.

If the fixture does not detect a network at one of the ports, it displays NO LINK instead of the network icon for that port.

- Below the current DMX address, the fixture displays in smaller characters the DMX channels that the fixture is currently using.

In the example shown in Figure 4:

- The fixture is running CPU software version 1.1.3
- The fixture is set to DMX Mode 1
- The fixture is set to receive data via DMX
- The fixture's DMX start address is 001
- The fixture is using DMX channels 1 to 24.

Using the control panel

The four control panel buttons at the sides of the display have the following functions.

In the main screen:

QUICK MENU – Activates the Quick Menu

MENU – Activates the control panel if it is in sleep mode, then opens the main menu

When navigating through the menus:

BACK – Goes back one level towards the top of the menu

UP – Scrolls up or increments a number

DOWN – Scrolls down or decreases a number

ENTER – Confirms a setting or implements a command

At any time:

UP and DOWN at the same time – Temporarily rotates the display 180°

UP or DOWN – Press three times to open the live diagnostic tool

Control button shortcuts

Battery Eco Mode (available in Battery Mode only)

When the fixture is running on battery power, holding MENU and ENTER together for 10 seconds activates Battery Eco Mode. This switches off the display completely to avoid any unwanted discharge of the battery and can be very useful when a fixture is put into long-term storage.

Live Diagnostics

Pressing UP or DOWN three times calls up an overview of all main fixture information, signal quality and settings. This can be useful if you are troubleshooting or if you are in contact with GLP Service.

Toggle Display Orientation

Pressing and releasing UP and DOWN together rotates the display through 180°.

*Note: If Display Orientation is set to **Auto**, changing the display orientation by pressing UP and DOWN at the same time will only change the display orientation until the next power cycle. To change the display orientation permanently, go to **Fixture Settings** → **Display Orientation** in the control panel menus.*

Error Messages

If the fixture detects an error, it displays an error message in the display. The Error is 'sticky' and will continue to be shown in the display until the next power cycle or reset. To get details of the error message, follow the information in the display. These details are important if you talk to GLP service.

Loss of DMX signal

The display flashes if the DMX signal is lost (the fixture will then behave according to its No Signal setting – see 'No signal' on page 22).

Service and maintenance

See the separate *impression X5 Bar 1000 Quick Start and Safety Manual* supplied with the fixture and available for download from www.glp.de for information on service and maintenance.

6. Setting up the control protocol

The impression X5 Bar 1000 can be controlled via:

- USITT512 DMX over a standard DMX cable link using the fixture's 5-pin XLR connectors,
- GLP's wireless iQ.Mesh technology.
- LumenRadio CRMX (optional). The integrated GLP FPO (Flexible Protocol Option) port allows the installation of an optional protocol module. If a LumenRadio CRMX module is installed, the fixture can be controlled via CRMX. Your GLP supplier can give you details of this module and other control protocol modules that are available.

This section explains how to configure the fixture to use one of these control data protocols.

*Note: The control protocol settings are not affected if you apply a **Fixture Settings** → **Load User Settings** → **Setting Defaults** command in the fixture's control panel, but they are returned to factory defaults if you apply a **Load Factory Defaults** command in the main menu.*

DMX

The fixture is set up for control via a standard DMX cable link by default.

If the control data protocol has been changed and you want to return to DMX control over a standard DMX cable link, open the menus in the fixture's control panel and make the following adjustments:

1. In the main menu in the fixture's control panel, open **DMX Address** and give the fixture a suitable DMX address.
2. In the **Protocol Setup** → **Data In** menu, set the control protocol to **DMX**.

iQ.Mesh

If you want to control the fixture via GLP iQ.Mesh:

1. Open the menus in the fixture's control panel.
2. In the **Protocol Setup** → **Data In** menu, set the control protocol to **iQ.Mesh**.

LumenRadio CRMX

If a LumenRadio CRMX module (available as an accessory) is installed in the fixture and you want to control the fixture via LumenRadio CRMX, open the menus in the fixture's control panel and make the following adjustments:

1. Open the menus in the fixture's control panel.
2. In the **Protocol Setup** → **Data In** menu, set the control protocol to **CRMX**.

7. Control menus

Quick menu

The control panel's Quick Menu gives you quick access to the most frequently used commands. To open the Quick Menu, press the left-hand control button marked >>> when the display is showing the default information screen.

The Quick Menu contains the following items:

Menus		Notes
Reset All		Resets the entire fixture (takes a few seconds).
Live Diagnostic		Calls up overview of all main fixture information, signal quality and settings.
iQ.Service Connect	>>>Connect<<<	Enables connectivity to the GLP iQ.Service App for 5 minutes.
Load User Settings	User Setting Preset 1	>>>Confirm<<<
	User Setting Preset 2	>>>Confirm<<<
	User Setting Preset 3	>>>Confirm<<<
	Setting Defaults	>>>Confirm<<<
Load Factory Defaults (!)	Displays Message: Fixture may lose connection to controller >>>Confirm<<<	Restores all factory default settings (including DMX address, protocol type, Ethernet / CRMX configuration, user offsets and user presets). Important! The fixture may lose contact with the controller!

Main menu

The following menus and commands are available in the impression X5 Bar 1000 control panel.

Menus		Notes
DMX Address		
001-512		Set fixture's DMX start address. Highest possible address depends on control mode.
Control Mode		
M1 Basic		Set fixture's DMX control mode.
M2 Normal		
M3 Segment		
M4 Multipix Advanced		
M5 Multipix Compressed RGB		
M6 Multipix Compressed RGBL		
Protocol Setup		
Data In	DMX	Control via DMX protocol
	iQ.Mesh	Control via GLP iQ.Mesh
	CRMX	Control via CRMX (only visible if CRMX module is installed)
Linking options	iQ.Mesh Unlink	Unlink from GLP iQ.Mesh link
	CRMX (FPO) Unlink	Unlink from CRMX (only available if CRMX module installed)
Fixture Settings		
Color Mix Mode	RGB	Direct RGB control, Lime added automatically
	RGBL	Direct RGBL control
	x:y	x:y color co-ordinate control
White Point	8000 K	Set fixture white point when RGB is at 100% (RGB Color Mix Mode only)
	6500 K	
	5600 K	
	4200 K	
	3200 K	
iQ.Gamut	FULL	Maximum color gamut
	Rec.2020	Color space defined to Rec.2020 Gamut (RGB Color Mix Mode only)
	Rec.709	Color space defined to Rec.709 Gamut (RGB Color Mix Mode only)
	DCI P3.65	Color space defined to DCI P3.65 Gamut (RGB Color Mix Mode only)

Dimmer Curve	Linear		Linear dimming curve
	Soft		Soft (square law) dimming curve
	S-Curve		Finer dimming control at low and high intensity
Fan Mode	Regulated		Fan speed temperature-regulated
	High		Fan speed constant high
	Medium		Fan speed constant medium
	Low		Fan speed constant low
	Minimum		All fans off or at minimum speed
Subfixture Mode	Normal		Main module's dimmer and shutter channels act as global dimmer/shutter and affect Sub module output
	Independent		Sub module is independent of Main module
Performance	Fast		Mechanical effects speed optimized for speed
	Normal		Mechanical effects speed balanced for speed and smoothness
	Smooth		Mechanical effects speed limited for optimized smoothness and low noise
PWM Frequency	Low (L)		Optimum fixed frequency for best dimming results at approx. 3000Hz
	Optimal (0)		Optimum dynamic frequency for best performance
	High 1 (H1)		Fixed frequency at approx. 4800 Hz
	High 2 (H2)		Fixed frequency at approx. 9600 Hz
	Max (M)		Highest possible fixed Frequency at approx. 25 kHz
Pixel Mirror	Off		Normal pixel layout
	Mirror Y		Pixels mirrored over y-axis
No Signal	No Signal Mode	Blackout	Fixture blacks out if no DMX signal received
		Hold	Fixture continues to display current effect if no DMX signal received
		Scene	Plays the stored captured scene (see next menu item) if no DMX signal received
	Capture DMX Values	>>>Confirm<<<	Captures current scene and stores it for use in No Signal Mode → Scene
Tilt Invert	OFF		Reverse direction of tilt movement
	ON		

Position feedback	OFF			Enable/disable /tilt position correction
	ON			
Tilt Disable	OFF			Disables tilt motor
	Current Disable			
Display Mode	Auto			Display dims after a short period of inactivity if no errors and valid DMX signal
	On			Display constantly on
	Off			Display dims even if there are errors / no DMX signal
Display Orientation	Auto			Display automatically inverts to match installation position
	Normal			Display normal (for use when fixture is standing)
	Flip			Display inverted (for use when fixture is flown head-down)
Hibernation	ON			Fixture enters energy saving mode, all electronics except DMX receiver are disabled. Cycling power off and on exits hibernation.
Load User Settings	User Setting Preset 1	>>> Confirm<<<	Apply a user preset to fixture settings	
	User Setting Preset 2	>>> Confirm<<<		
	User Setting Preset 3	>>> Confirm<<<		
	Setting Defaults	>>> Confirm<<<	Return fixture to default settings (not including DMX address, protocol type, Ethernet / CRMX configuration, user offsets, user presets and counters)	
Information				
Live diagnostic			Shows overview of fixture information	
Show errors			Shows any stored errors	
Show temperature			Shows fixture temperature	
Show fan status			Shows current cooling fan status	
Show controllers info			Shows controllers info	
Show iQ.Mesh status			Shows current GLP iQ.Mesh status	
Show LED calibration			Shows LED calibration information	
Show fixture counters			Shows total device hours (non-resettable), resettable device hours, total power cycles (non-resettable), resettable power cycles, resettable air filter hours	
Show DMX input			Shows DMX values being received	
Show DMX info			Shows info about any lost DMX packages	

Manual Control			
Reset All		Reset all effects	
Reset Tilt		Reset tilt only	
Reset Head		Reset all effects except tilt	
Manual DMX	Tilt	001 - 128 - 255	Manually control all effects
	Intensity	000 - 255	
	...	Scroll through all effects	
	...		
	Blue - All Pixel	000 - 255	
Press Enter	Lime - All Pixel	000 - 255	Reset all manually entered DMX values to zero
	Reset Manual Values	Confirm for 3 seconds (press Enter)	
Service			
Live diagnostic		Shows overview of fixture information	
iQ.Service Connect	>>> Connect <<<	Enables connectivity to the GLP iQ.Service app.	
Tests	Test All		Run test sequence of all effects including tilt. Stop with BACK.
	Test Tilt		Run test sequence of tilt only. Stop with BACK.
	Test LED		Run test sequence of all LEDs. Stop with BACK.
	Test Zoom		Run test sequence of zoom effect. Stop with BACK.
	Test Fans (Auto)		Run fan self-test. Tries to detect fan errors, clears if successful.
	Test Fans (Manual)		Manually test fans one by one
	Test Encoders		Auto test for all encoders

Advanced (Press and hold for 3 secs.)	Service Mode	OFF		Normal operation
		ON		Disable tilt and display timeouts (exit by cycling power off and on.)
	Job offsets	Tilt Zoom		Create custom job offsets in home positions of all effects. Default offset = 0 Note: This function is not fixture calibration!
	Reset counters	Lamp Hours	Confirm 2 seconds	Reset to zero
		Service Timer	Confirm 2 seconds	
		Air filter	Confirm 2 seconds	
	Save User Settings	User Setting Preset 1	Confirm 2 seconds	Saves current fixture settings as user settings preset
		User Setting Preset 2	Confirm 2 seconds	
		User Setting Preset 3	Confirm 2 seconds	
	Firmware push (Fixture2fixture)	>>> Confirm <<<		Push fixture's firmware to all other fixtures of the same type over the DMX link
Load factory defaults				
>>>Confirm<<<			Reloads all factory default settings and default fixture configuration settings. Important! Controller may lose connection to fixture!	

Default settings are written in **BOLD type**

8. Error messages

When restarting the fixture or sending a RESET command, the fixture performs an initialization process to test all functions and sensors. The fixture also continuously checks itself for correct operation.

If an error is detected, the fixture display shows the message **ERROR**.

- Pressing **X** ignores the error message and exits the error display.
- Pressing **✓** shows information about the error.

Note: Make a note of any error message displayed. You may need these details for error diagnosis. Please be ready to give them to GLP Service if necessary.

Certain critical error messages are permanently stored in the display. In this case, please contact your GLP service agent.

9. Pixel layout

The impression X5 Bar 1000 pixels are located as shown above, seen from the front of the fixture with tilt at >50% and **Pixel mirror** → **y-mirror** set to **Off**.

You can mirror the pixels over the y axis (inverting the order of the pixels so that they run from pixel 18 on the left to pixel 1 on the right in the illustration above) if you set **Pixel mirror** to **y-mirror** in the **Fixture Settings** options available in the fixture's control panel, on the Control/Settings DMX channel or via RDM.

10. DMX control modes overview

The following DMX control modes are available in the impression X5 Bar 1000.

DMX channels from 1 to 7 have the same functionality in all the DMX control modes.

DMX Mode 1: Basic

20 DMX Channels

Basic DMX Mode gives control of the fixture's main functions. Tilt, dimming and the color mixing channels are available with 16-bit control resolution. A shutter channel gives direct change between open and blackout plus a range of intensity effects. Zoom is also available with 8-bit resolution. The Control/Settings channel lets you adjust fixture settings via DMX.

The color control channels offer color mixing using either [1] RGB, [2] RGBL or [3] x;y color gamut coordinates, depending on which of these three methods is active. You can select the color mixing method via DMX on the Control/Settings channel, via RDM or using the fixture's control panel. Additional color options channels include a color wheel with a wide range of color presets, a CTC channel, magenta/green shift adjustment and a tungsten simulation channel. The CQC channel lets you select if the fixture should give priority to color rendering or output intensity in its white output. This channel also offers an easy way of desaturating colors.

DMX Mode 2: Normal (default)

33 DMX channels

Normal DMX Mode is split into a **Main Module** and a **Sub Module**.

The **Main Module** gives control of the main functions, as in **Basic DMX Mode**. Tilt, dimming and the color mixing channels have 16-bit control resolution. A shutter channel gives direct change between open and blackout plus a range of intensity effects. Zoom is also available with 8-bit resolution. The Control/Settings channel lets you adjust fixture settings via DMX.

The color control channels in the Main Module offer color mixing using either [1] RGB, [2] RGBL or [3] x;y color gamut coordinates, depending on which of these three methods is active. You can select the color mixing method via DMX on the Control/Settings channel, via RDM or using the fixture's control panel. Additional color options channels include a color wheel with a wide range of color presets, a CTC channel, magenta/green shift adjustment and a tungsten simulation channel. The CQC channel lets you select if the fixture should give priority to color rendering or output intensity in its white output. This channel also offers an easy way of desaturating colors.

The Mix Priority channel defines how the output of the Main and Sub Module is merged or overlaid.

The **Sub Module** forms a second layer. The Sub Module channels provide intensity and shutter control, a powerful static and dynamic pattern effects engine with step crossfading and pattern transition options, plus RGB color control of all 18 pixels as one group.

DMX Mode 3: Segments

48 DMX channels

Segment DMX Mode is split into a Main Module and a Sub Module.

The **Main Module** gives control of the main functions, as in **Basic** DMX Mode. Tilt, dimming and the color mixing channels have 16-bit control resolution. A shutter channel gives direct change between open and blackout plus a range of intensity effects. Zoom is also available with 8-bit resolution. The Control/Settings channel lets you adjust fixture settings via DMX.

The color control channels in the Main Module offer color mixing using either [1] RGB, [2] RGBL or [3] x;y color gamut coordinates, depending on which of these three methods is active. You can select the color mixing method via DMX on the Control/Settings channel, via RDM or using the fixture's control panel. Additional color options channels include a color wheel with a wide range of color presets, a CTC channel, magenta/green shift adjustment and a tungsten simulation channel. The CQC channel lets you select if the fixture should give priority to color rendering or output intensity in its white output. This channel also offers an easy way of desaturating colors.

The Mix Priority channel defines how the output of the Main and Sub Module is merged or overlaid.

The **Sub Module** forms a second layer. The Sub Module channels provide intensity and shutter control, a powerful static and dynamic pattern effects engine with step crossfading and pattern transition options, plus RGB color control of six pixel groups as segments.

DMX Mode 4: Multipix Advanced

84 DMX Channels

Multipix Advanced DMX Mode is split into a Main Module and a Sub Module.

The **Main Module** gives control of the main functions, as in **Basic** DMX Mode. Tilt, dimming and the color mixing channels have 16-bit control resolution. A shutter channel gives direct change between open and blackout plus a range of intensity effects. Zoom is also available with 8-bit resolution. The Control/Settings channel lets you adjust fixture settings via DMX.

The color control channels in the Main Module offer color mixing using either [1] RGB, [2] RGBL or [3] x;y color gamut coordinates, depending on which of these three methods is active. You can select the color mixing method via DMX on the Control/Settings channel, via RDM or using the fixture's control panel. Additional color options channels include a color wheel with a wide range of color presets, a CTC channel, magenta/green shift adjustment and a tungsten simulation channel. The CQC channel lets you select if the fixture should give priority to color rendering or output intensity in its white output. This channel also offers an easy way of desaturating colors.

The Mix Priority channel defines how the output of the Main and Sub Module is merged or overlaid.

The **Sub Module** forms a second layer. The Sub Module channels provide intensity and shutter control, a powerful static and dynamic pattern effects engine with step crossfading and pattern transition options, plus RGB color control of each individual pixel.

DMX Mode 5: Multipix Compressed RGB

63 DMX Channels

MultiPix Compressed RGB DMX Mode gives control of the main functions, as in **Basic** DMX Mode, plus RGB color control of each individual pixel. Tilt and dimming have 16-bit control resolution. A shutter channel gives direct change between open and blackout plus a range of intensity effects. Zoom is also available with 8-bit resolution. The Control/Settings channel lets you adjust fixture settings via DMX.

The CTC Channel lets you temporarily change from the fixed white point to any other color temperature. The CQC channel lets you select if the fixture should give priority to color rendering or output intensity in its white output. This channel also offers an easy way of desaturating colors.

RGB color mixing is carried out on the individual pixel control channels.

		Green, pixel 18	62
		Blue, pixel 18	63

DMX Mode 6: Multipix Compressed RGBL

81 DMX Channels

MultiPix Compressed RGBL DMX Mode gives control of the main functions, as in **Basic** DMX Mode, plus RGBL color control of each individual pixel with Lime added automatically.

Tilt and dimming have 16-bit control resolution. A shutter channel gives direct change between open and blackout plus a range of intensity effects. Zoom is also available with 8-bit resolution. The Control/Settings channel lets you adjust fixture settings via DMX.

The CTC Channel lets you temporarily change from the fixed white point to any other color temperature. The CQC channel lets you select if the fixture should give priority to color rendering or output intensity in its white output. This channel also offers an easy way of desaturating colors.

RGBL color mixing is carried out on the individual pixel control channels.

11. DMX control channel layout

In the following DMX channel layout tables:

- Default settings are indicated with **bold type**.
- Where commands are marked **(3 sec.)**, you must send that DMX value continuously for 3 seconds (or other duration if indicated in the table) to apply the command.
- Percentage equivalents are rounded up or down to the nearest 0.1%

To reduce the risk of accidentally changing settings, the commands on the Control / Settings channel must be held for a certain time before they are executed. The above table indicates the number of seconds that you must hold a command.

12. Key to conversion of x and y coordinates

The following formulas are used when converting DMX values to x/y coordinates on the RGB and RGBL color mixing channels:

8-bit

$$\text{DMX } x = \frac{x \text{ co-ordinate} \times 255}{0.8}$$

$$\text{DMX } y = \frac{y \text{ co-ordinate} \times 255}{0.8}$$

16-bit

$$\text{DMX } x = \frac{x \text{ co-ordinate} \times 65535}{0.8}$$

$$\text{DMX } y = \frac{y \text{ co-ordinate} \times 65535}{0.8}$$

13. Color wheel specifications

The following table gives the color gamut co-ordinates of the color presets available on the color wheel effect.

Filter 004, Medium Bastard Amber	0.37;0.335
Filter 019, Fire	0.664;0.31
Filter 025, Sunset Red	0.566;0.359
